		7.1.31	
		7.1.32	PopupController accessible
			DockRelocator updated

Abstract

This document describes the most important changes between versions, and how developers should change their application in order to use new features. This document does not make any distinction between the core-library and the common-project. Not all changes are listed up in this document, only those enhancements which might be interesting for the majority of developers.

1 Version 1.0.3

Version 1.0.3 emphasizes on background enhancements. The API remains unchanged for most parts.

1.1 Incompatibilities

These changes break with the API from 1.0.2, clients must change their interfaces in order to work properly.

1.1.1 DefaultKeyboardController

Short The class DefaultkeyBoardController has been renamed to DefaultKeyboardController

Reason The new name looks better

Clients Replace any occurrence of DefaultkeyBoardController to DefaultKeyboardController

1.1.2 DefaultDockable/DefaultCDockable

Short DefaultDockable and DefaultCDockable now have BorderLayout set as default LayoutManager

Reason BorderLayout is the most often used LayoutManager.

Clients If another LayoutManager than BorderLayout is needed, set it up.

1.1.3 CDockableListener

Short CDockableListener divided into CDockableStateListener and CDockablePropertyListener

Reason CDockableListener was to big. Most clients either need information about the state, or about the properties of a CDockable. The case that both informations are needed is seldom.

Clients Need to decide which listener they implement. Note that CDockableAdapter implements both listeners, but not all methods get invoked when the adapter is registered only as one kind of listener.

1.1.4 FlapDockStation

Short FlapDockStations layout is stored in a new format. The xml format will do the transition automatically, but the DataInput/OutputStream will not work properly.

Reason the old format did not carry enough information

Clients Store the layout in xml-format and load it again to do the transition.

1.1.5 XML

Short XElement now extends

 ${\tt XContainer}, {\tt and no longer} {\tt XAttribute}. {\tt XAttribute} {\tt extends} {\tt XContainer}$ as well

Reason An element of a xml file is not an attribute, that is now reflected in the class structure

Clients May need to replace some occurrences of XAttribute by XContainer

1.1.6 DockTheme

Short The common-project uses its own set of DockThemes. Each theme XTheme gets replaced by CXTheme

Reason The new themes make use of the new ColorMap

Clients Should use the new themes when possible. The old themes will work, but the user will see less features.

1.1.7 DockFactory

Short DockFactories can now create any Object they want, and are no longer required to create DockLayouts. DockLayout has been converted into a class that wraps the Object that was created by a DockFactory

Reason All DockLayouts need to do the same things, hence clients would need to write the same code over and over again. Clients have now more freedom in how to implement DockFactory

Clients Should remove all occurrences of implements DockLayout and the methods set/getFactoryId that were defined in DockLayout

1.2 Features

This is the set of new features.

1.2.1 SplitDockStation

Short The tree of elements of a SplitDockStation is now accessible from outside and can be modified directly

Reason It is more intuitive to work directly with the tree, some new algorithms work on the tree and are easier to implement that way.

1.2.2 SplitLayoutManager

Short New SplitLayoutManager calculates where to drop, and how to divide, elements of a SplitDockStation

Reason New features, like the locked size of CDockable, were only possible if the behavior of a SplitDockStation can be changed on runtime.

1.2.3 CDockable resize lock

Short The size of a CDockable can be locked during resize of its parent. See setResizeLocked, a method of AbstractCDockable.

Reason This was a request from a user

1.2.4 FlapLayoutManager

Short FlapDockStation now uses FlapLayoutManager to arrange its children

Reason Exchangeable behavior was a requirement for new features in the common-project.

1.2.5 ColorManager/ColorScheme

Short Many graphical elements now use ColorManager and ColorSchemes

Reason Colors can now be exchanged by clients. The control goes deep, even the color of a single element can be exchanged without affecting other elements of the same kind.

1.2.6 ColorMap

Short CDockable uses a ColorMap to define special colors for tabs and titles that are related to the CDockable

Reason This was a request from a user

1.2.7 LookAndFeel

Short Changes of LookAndFeel noted by DockController and forwarded to all UIListeners.

Reason Because the ColorManager would not be informed of the new LookAndFeel otherwise

1.2.8 CDockable resize request

Short CDockables can now request a size they would like to have, and in most environments they will get this size. See the method setResizeRequest of AbstractCDockable.

Reason This was a request from a user

2 Version 1.0.4

Version 1.0.4 introduces a few new features that add customizability

2.1 Incompatibilities

These changes break with the API from 1.0.3, clients must change their interfaces in order to work properly.

2.1.1 Binary file format

Short The binary file format has been changed

Reason The format now includes version numbers so that backwards compatibility should be possible in the next versions

Clients Need to delete all binary files. They might try to write their properties with the old version in xml, and then load the xml file with the new version. This should convert the files.

2.1.2 DockableListener

Short Has an additional method titleExchanged

Reason Allows to exchange a DockTitle while the Dockable is visible

Clients Need to update any class that implements DockableListener.

2.1.3 Title visibility on CDockables

Short Any CDockable can now hide its titles at any time

Reason user request

Clients Need to update any class implementing CDockablePropertyListener since that listener has an additional method titleShownChanged.

2.1.4 BasicDropDownButtonHandler

Short Requests now a BasicDropDownButtonTrigger instead of a BasicTrigger

Reason to allow steering any drop down action with the keyboard.

Clients unlikly to have an effect on any client

${\bf 2.1.5}\quad {\bf CDockable.getClose}$

Short Method has been moved into CommonDockable

Reason The action can now be replaced through CDockable.getAction.

There is no need for any client to replace the action by replacing the whole DockActionSource

Clients should use putAction, a method of AbstractCDockable to exchange the close-action. No fix for clients which added additional elements to the close-source.

2.1.6 CLocation

Short Additional CLocations, some methods have been moved

Reason To allow the new CStation more flexible CLocations were needed.

Clients No general solution available, clients should recompile their project and check all compiler errors.

2.1.7 working area

Short Every CStation can now be a working area

Reason To allow more flexibility in grouping CDockables

Clients That should not be visible for any client using version 1.0.3

2.2 Features

This is the set of new features.

2.2.1 Border around BubbleDisplayer

Short BubbleDisplayer now shows a border if the title is not null, or if the dockable is not a station

Reason Looks better

2.2.2 Backup factories (core)

Short DockFrontend and PredefinedDockSituation can now use backup factories. These factories are used to load elements which should be in the cache, but are missing. In case of DockFrontend they are automatically added to the frontend.

Reason Removes the need to add all Dockables to a DockFrontend before loading a layout from a file.

2.2.3 Backup factories (common)

Short CControl now supports lazy initialisation of SingleCDockables through the SingleCDockableBackupFactory.

Reason saves memory

2.2.4 Unregister factories from DockFrontend

Short DockFactorys can now be unregistered from DockFrontend

Reason Was missing

2.2.5 Action support keyboard

Short DockActions are triggered by pressing SPACE on the focused button, DropDownActions pop up when the DOWN (non numpad) key is pressed

Reason Ongoing work to allow navigating in DF without the mouse.

2.2.6 FocusTraversalPolicies

Short New FocusTraversalPolicys allow to navigate within all elements of a DockableDisplayer (including title).

Reason Ongoing work to allow navigating in DF without the mouse.

2.2.7 override predefined actions

Short CDockable has an additional method getAction which is used by various modules to override their default actions.

Reason Answer to a user request

2.2.8 CBlank

Short New action CBlank, which does not show anything.

Reason As value for CDockable.getAction when a predefined action should be hidden

2.2.9 CStation

Short Additional interface CStation in common. Two new stations: CMinimizeArea and CGridArea.

Reason Allows clients to add their own DockStations to CControl, allows to create other layouts than the "one center, four minimize areas"-layout.

2.3 Bugfixes

These are the bugs that were fixed/

2.3.1 BubbleDisplayer.getDockableInsets

Short The method did not calculate its result correctly.

 ${f Reason}$ A flaw in the design of BasicDockableDisplayer

${\bf 2.3.2} \quad IndexOutOf Bounds Exception\ from\ Button Panel$

Short The exception was thrown when an invisible action was on the panel

Reason invisible actions were not considered when writing ButtonPanel

2.3.3 Mode change of CDockable

Short CDockable did not go into normalized-mode when externalized and never normalized before

Reason Properties were missing and could not be created automatically

2.3.4 Opening maximized CDockable

Short CDockable could not be opened maximized.

Reason framework got confused because CDockable did not have a parent.

2.3.5 Unbind of DockAction called to often

Short A DockAction could throw an exception "unbind called to often"

Reason When a DockAction was a child of a MenuMenuHandler, its unbind method was called even if the action was not displayed. However the bind action was called only if the action was displayed, so the internal counter was no longer correct. Every time a menu with such an action was shown, the counter was decremented by one. When it reached a value below 0, an exception was thrown. Since an action could be bound by many elements, the exception occurred at random places.

3 Version 1.0.5

Version 1.0.5 brings the possibility to navigate around only by hitting some keys on the keyboard. When clicking the ctrl+shift+e combination, a dialog opens on which a Dockable can be selected.

DockActions in button form can be activated with space, and the dropdown actions menu can be opened with the arrow down key.

This release contains some tricky incompatibilities which need to be handled very carefully.

3.1 Incompatibilities

The changes that need special care.

3.1.1 DockStationListener

Short The method dockableSelected of DockStationListener has an additional parameter that indicates which element was selected before the change.

Reason No need for listeners to store the old values.

Clients Must carefully update all classes and interfaces that implement DockStationListener. Be especially careful not to mix up the new arguments with the old ones.

3.1.2 DockableFocusListener

Short The DockableFocusListener has been divided into two interfaces:

DockableFocusListener and DockableSelectionListener. The
remaining method in DockableFocusListener now takes a
DockableFocusEvent and no longer directly the involved elements. The
class DockableFocusAdapter has been deleted.

Reason Events allow further changes of the system without change of the DockableFocusListener itself. Since every client needs to update its methods anyway, DockableFocusAdapter could be deleted.

Clients Should use DockableFocusListener instead of DockableFocusAdapter.

3.1.3 DockTheme.getDockableSelection

Short DockTheme has an additional method getDockableSelection.

Reason A DockableSelection is needed to change the focused Dockable using only the keyboard. Since DockableSelection is a graphical element, it has to be handled by the DockTheme.

Clients Should implement the missing method in their DockThemes. Using DefaultDockableSelection is an easy solution.

3.1.4 tap-strip no longer painted by TapPainter

Short TabPainter does no longer paint the tab-strip directly. It now creates a TabStripPainter that paints the strip.

Reason The new object can work with the color map.

Clients Have to provide a TabStripPainter as well.

3.1.5 KeyboardController does fire less events

Short The KeyboardController does no longer fire events when it could not find the source-Dockable of the event. As a result the KeyboardListener does no longer receive null as argument of any of its methods.

Reason Events were fired which had nothing to do with the framework at all.

Clients If they need all key events, then they can add a global KeyListener to KeyboardController using the method addGlobalListener.

3.1.6 ComponentHierarchyObserver

Short The ComponentHierarchyObserver includes more Components in its search. The ComponentHierarchyObserverListener now works with an event and does no longer receive all the elements as arguments.

Reason Allows more features to work correctly in restricted environments.

Clients Need to be aware that not every **Component** that is found by the observer is a child of a **Dockable**.

3.2 API and Layout

A list of new API elements and changes that affect the layout.

3.2.1 KeyStroke for closing Dockable

Short The KeyStroke for closing a CDockable or Dockable has been changed from ctrl+c to ctrl+F4.

Reason Andrew pointed out, that ctrl+c is already used by many applications...

3.2.2 New listeners

Short There are new listeners, CFocusListener, CKeyboardListener and CDoubleClickListener, which can be added to CDockable or to CControl if all CDockables should be monitored.

Reason Might be helpful for some applications

3.2.3 ComponentHierarchObserver

Short Clients can now add and remove Components from the ComponentHierarchyObserver. The observer also includes DockTitles in its search for Components.

Reason Might become necessary for complex applications that run in a restricted environment.

3.2.4 Root window for DockController

Short The DockController can now find the root window of the application. The window can also be set directly using setRootWindow. If so, then the root window is added to the ComponentHierarchyObserver.

Reason Necessary to show small dialogs like the new DockableSelector

3.2.5 FocusTraversalPolicies

Short All DockThemes now support FocusTraversalPolicies. Now each DockAction and all Components of a Dockable can be reached by using only the keyboard.

Reason A nice feature for people which do not like the mouse

3.2.6 Dialog to select focused Dockable

Short The DockableSelector and DockableSelection allow users to select the focused Dockable using only the keyboard. The feature is activated as soon as ctrl+shift+e is pressed.

Reason A nice feature for people which do not like the mouse

3.2.7 Extracting colors from LookAndFeel

Short The mechanism to read colors from LookAndFeels has been upgraded. Each LookAndFeel can now have its own specialized LookAndFeelColors that reads the colors.

Reason Allows to be more flexible with colors, allows the correct use of Nimbus and Windows.

3.2.8 EclipseTheme

Short EclipseTheme uses more colors from the LookAndFeel

Reason looks better

3.2.9 SplitDockStation

Short When dropping an element onto a **SplitDockStation**, the elements that are put aside receive at least a quarter of their original size.

Reason Sometimes the old elements shrunk too mutch.

3.3 Bugfixes

3.3.1 Missing colors for BasicTheme

Short BasicTheme did not update colors for the keys paint.line, paint. divider and paint.division. As a result some painting was not as in the older versions.

3.3.2 Cutting bounds of children of SplitDockStation

Short The bounds of children of SplitDockStation are now cut such that they are always within the stations boundaries.

Reason Rounding errors sometimes lead to little failures that made a single line of pixels invisible.

3.3.3 NullPointerException when changing focus

Short A NullPointerException could been thrown when the focus changed.

3.3.4 Undecorated dialogs not undecorated

Short When using LookAndFeels that can draw window decorations on their own (like JTattoo), then FlapWindow, ScreenDockDialog and others could have decorations.

Reason The flag that advices the LookAndFeel not to paint a decoration was not set in the JRootPanes of these windows.

3.3.5 RexTabbedComponent not adding/removing children

Short RexTabbedComponent does no longer add and remove its children to change their visibility, it now uses a CardLayout.

Reason Some Components did miss the change of the LookAndFeel when they were a child of RexTabbedComponent.

3.3.6 Focusing a hidden CDockable

Short When focusing a normalized CDockable that was hidden behind a maximized CDockable, then the focused dockable did not became visible.

Reason An old security system prevents change of the maximized element by the focus system.

3.3.7 Missing events when changing state of CDockable

Short When the ExtendedMode of a CDockable did not change because of a call of a special method, no state-change-events were fired.

Reason It was not intended that one action could change the state of many CDockables.

4 Version 1.0.6

This version brings the preference system. The API was changed at some places in order to bring the preference system to work.

4.1 Incompatibilities

The changes that need special care.

4.1.1 Dockable with Tooltip

Short Dockable has a new method getTitleToolTip. DockableListener has a new method titleToolTipChanged.

Reason Allows to show a tooltip for a Dockable on titles and on tabs.

Clients Must implement the two new methods.

4.1.2 ColorManager generalized

Short ColorManager extends UIProperties, ColorProvider is replaced by ColorBridge which extends

UIBridge, DockColor extends UIValue.

ColorManager.getProviderFor is replaced by

UIProperties.getBridgeFor. Bridges and Values are no longer connected though the class of the UIValue but by a Path object. These objects are much more flexibel than classes and not hard to understand.

Reason This generalization will allow to use the UIProperties for other things than just colors. There are plans to use the same system for fonts as well.

Clients Should replace ColorProvider by UIBridge

4.1.3 Resize Request in Common

Short Size requests are now handled by RequestDimension and no longer with Dimension.

Reason Allows to issue requests only for with or for height.

Clients Have to replace occurences of Dimension by RequestDimension.

4.1.4 DockElementRepresentative

Short Dockable and DockTitle implement the interface DockElementRepresentative

Reason Allows unified access to all Components which are linked to a Dockable.

Clients Have to implement the additional methods of DockElementRepresentative

4.1.5 SimpleModifierMask deleted

Short The class SimpleModifierMask has been removed. The interface ModifierMask has been changed to be a class effectively replacing SimpleModifierMask.

Reason This was necessary for the preference system. It was also unlikely that a client would ever implement ModifierMask.

Clients Must replace SimpleModifierMask by ModifierMask.

4.1.6 Map of DockThemes

Short CControl has now a ThemeMap. This map contains String-ThemeFactory pairs. A new theme can be activated by calling ThemeMap.select.

Reason This is a simple representation of all the choices a user can do. The CThemeMenuPiece and the preference system can use the map to show choices and selection.

Clients Instead of using CControl.setTheme(DockTheme) they should use CControl.setTheme(String). Additinal ThemeFactorys have to be added directly to the ThemeMap, CThemeMenuPiece does no longer support inserting factories.

4.1.7 Persistent storage of DockTheme

Short The DockTheme of a CControl is no longer stored by the CThemeMenuPiece but directly by its ThemeMap.

Reason The ThemeMap is always present, the CThemeMenuPiece not. Hence if the ThemeMap is responsible for storing the theme, then the theme gets always stored.

Clients Cannot do anything. The setting of the theme will be lost the next time the application starts and has to be set anew.

4.2 API and Layout

A list of new API elements and changes that affect the layout.

4.2.1 Dropping onto SplitDockStation

Short When dropping something onto a SplitDockStation, the old content always gets at least 25% of the remaining space.

Reason In some situations the old content get no space and became invisible.

4.2.2 UIProperties

Short New UIProperties, a generalisation of ColorManager.

Reason Precondition to implement a similar system for fonts.

4.2.3 Opened LockedResizeLayoutManager

Short The private inner classes of LockedResizeLayoutManager have been made public and top level.

Reason Clients have better access and can better customize LockedResizeLayoutManager.

4.2.4 ConflictResolver for locked resize

Short The ConflictResolver in Common can now be used to resolve conflicts on resize when locked CDockables are around. Can be applied using the key CControl.RESIZE_LOCK_CONFLICT_RESOLVER.

Reason Developers wished to have the choice between different behaviors.

${\bf 4.2.5} \quad {\bf FullLockConflictResolver}$

Short A new ConflictResolver which is inspired by the behavior of VLDocking

Reason User request

4.2.6 DockElementRepresentative

Short New interface DockElementRepresentative. Creates a link between a Component and a DockElement.

Reason Gives a unified way to handle popup menus and drag and drop operations.

4.2.7 Common: close-action and setVisible

Short Clicking onto the close-action and calling setVisible(false) on a CDockable will now have the exact same effects.

Reason Seems to be reasonable that the close action just calls setVisible.

4.2.8 Preference system

Short A new system has been put in place to handle preferences. This new system is located in the package bibliothek.extension.gui.dock.

Reason This new system allows users to see and change various properties of the library. This includes things like the shortcuts for actions (like ctrl+m for maximizing a Dockable) or which colors are used by BubbleTheme. Future releases might contain more preferences.

4.2.9 ColorScheme as property

 ${\bf Short} \ {\tt BasicTheme} \ {\tt and} \ {\tt subclasses} \ {\tt read} \ {\tt their} \ {\tt ColorScheme} \ {\tt from} \ {\tt the} \\ {\tt DockProperties}.$

Reason a condition for the preference system

4.2.10 Default locations in Common

Short Clients can set the default location of a Dockable in Common. The method setLocation of CStateManager can be used for that. Also AbstractCDockable has a new method setDefaultLocation which can be used even if the element is not yet added to a CControl.

Reason user request.

4.2.11 Borders on OverpaintablePanel

Short OverpaintablePanel now supports Borders.

Reason Every Component should support Borders.

4.2.12 SplitDockStation can disabled resizing

Short Resizing on a SplitDockStation can be disabled.

Reason Requested by a user.

4.2.13 Handle AWT components

Short The AWTComponentCaptureStrategy can be used to create images from AWT components.

Reason AWT components cannot be handled like Swing components, the mechanism normally used created just a blank image.

4.3 Bugfixes

4.3.1 DefaultConflictResolver did not respect locked sizes

Short When several ResizeRequests with different priority had to be handled, DefaultConflictResolver did not respect all of them. The algorithm has been fixed.

4.3.2 Opening maximized CDockable

Short When opening a CDockable which would stack on a maximized CDockable, then the layout could get scrambled. The solution is now to unmaximize any CDockable, then add the new element, then re-maximize the CDockables.

4.3.3 Dropping Dockable on SplitDockStation

Short Dockables can now be dropped onto SplitDockStations which have size 0/0. In earlier versions the divider between Dockables had a fixed size in pixels. Now the size of the divider is set to 0 if the SplitDockStation is too small. This prevents children to have negative sizes.

4.3.4 CSplitLocation broken

Short CSplitLocation.expandProperty did process the first element of a tree-path twice (thanks srcnick for fixing this bug).

4.3.5 CStateManager.getLocation broken

Short CStateManager.getLocation did return null when it should produce a result. There were also some CLocations which did not return the correct result causing getLocation to fail.

4.3.6 Stack-component of EclipseTheme broken

Short When removing all elements of EclipseStackDockComponent, some elements could remain invisible.

4.3.7 Change ColorScheme could throw NPE

Short When updating the colors of a BasicDockTheme which was not installed, a NullPointerException was thrown.

4.3.8 Items in popup-menu did do nothing

Short Some DockActions where not correctly wird when in a popup-menu. Clicking them would not result in any action (affects all SelectableDockActions).

5 Version 1.0.7

Version 1.0.7 emphasizes on details. Many bugfixes are included and new settings allow further customization. The layout-storage mechanism has been improved to support missing dockables.

5.1 Incompatibilities

The changes that need special care.

5.1.1 DockableDisplayerHints

Short Dockable has a new method configureDisplayerHints.

Reason This allows Dockables to communicate with their DockableDisplayer s. For example a SplitDockStation tells its displayer to paint a border if the station has no children, but not to paint a border if it has children.

Clients If implementing Dockable directly need to add this method.

5.1.2 ScreenDockDialog extends new class

Short ScreenDockDialog extends other classes than before.

Reason The whole management of dialogs for ScreenDockStation has been rewritten. A ScreenDockStation now supports any kind of window, not only dialogs.

Clients Should not be affected.

5.1.3 DockFactory uses a new layer

Short The whole layout-storage mechanism has been updated.

Reason To support missing dockables a new layer containing meta information was necessary.

Clients The interface DockFactory contains new and changed methods

5.1.4 CGridArea implements CDockable

Short CGridArea is no longer just a panel but can also be used as dockable.

Reason In order to use CGridArea as superclass for CWorkingArea this interface was needed.

Clients Should not affect clients.

5.1.5 CWorkingArea extends CGridArea

Short CWorkingArea is now a subclass of CGridArea.

Reason CWorkingArea and CGridArea have almost the same behavior. New interfaces and lesser coupling allowed to reuse CGridArea. In a future release they might even be merged into one class.

Clients Most clients should not notify this change, clients that use code like x instanceof CGridArea need to be updated.

5.1.6 CControlFactory: no longer creates CWorkingAreas

Short CControlFactory no longer creates CWorkingAreas but SplitDockStations.

Reason This is part of an ongoing effort to lessen the coupling of classes in Common.

Clients Clients that used a customized CControlFactory may need to update their factory.

5.1.7 CommonDockable: getClose replaced with getSources

Short In CommonDockable the method getClose was replaced with getSources.

Reason This way a CommonDockable can support more than just one special DockActionSource. Also the close-action-source is no longer integrated that tight into the system.

Clients Since clients should not work on this level anyway they don't need to worry.

5.1.8 PropertyKey: requires factory for default value

Short PropertyKey requires a PropertyFactory to set up its default value.

Reason Fixes a memory leak by preventing PropertyKey from sneaking in global variables.

Clients Need to implement the factory if they create new PropertyKeys.

5.2 API and Layout

A list of new API elements and changes that affect the layout.

5.2.1 Button-title supports colors

Short The button-title on FlapDockStation can change its color, new keys for that feature are provided in ColorMap.

Reason Was just missing.

5.2.2 FlapDockProperty: support state and size

Short FlapDockProperty stores now holding state and window size as well.

Reason Allows clients more control over the layout, was necessary for Common.

5.2.3 AdjacentDockFactory

Short The AdjacentDockFactory can store additional information about a Dockable when writing a layout.

Reason Was required for Common.

5.2.4 DockSituation: support for missing elements

Short DockSituation has a number of new methods to support missing or invisible elements. The new methods are fillMissing and estimateLocations.

Reason Makes the user interface more consistent if missing elements are made available later.

5.2.5 Support for gaps in layout

Short DockFrontend now tries to fill missing gaps in the layout before a layout is applied.

Reason Makes the user interface more consistent if missing elements are made available later.

5.2.6 Storing information of invisible dockables

Short DockFrontend stores layout information of invisible/missing elements.

Reason Otherwise information would be lost and the user interface would seem inconsistant.

5.2.7 Access to information of missing dockable

Short New methods listFrontendEntries and getFrontendEntry in DockFrontend.

Reason The methods allow access to all information of missing (and normal) Dockables.

5.2.8 PreferenceTable: order of operations reversed

Short The order of "default" and "remove" operation are reversed.

Reason The "default" operation should be the last operation.

5.2.9 Automatic stack creation in CGrid

Short Eduardo Born suggested that if some dockables are placed at the same location in a CGrid then they should be put together in a stack.

Reason There is no reason not to do it this way.

5.2.10 Central register for CDockables

Short CControl stores all its stations and dockables now in a CControlRegister.

Reason New classes are introduced to free CControl of minor tasks.

5.2.11 FontManager

Short New methods to change the fonts on titles and tabs. The interface DockFont provides some keys that can be used together with FontManager.

Reason That's a feature every docking-framework should have

5.2.12 FontMap

Short Common supports the new font system, the FontMap can be used like the ColorMap.

Reason Because Core allows this.

5.2.13 More than one maximize-area

Short In Common more than only one station can now be marked as being potential parent of a maximized CDockable.

Reason Part of ongoing work for less coupling in Common.

5.2.14 Veto before changing layout

Short The method hiding of VetoableDockFrontendListener is called when setting a new layout.

Reason Prevents dockables to disappear that must always be visible

5.2.15 CGrid/SplitDockGrid: preselect element

Short CGrid/SplitDockGrid have a new method select/setSelected to select a CDockable/Dockable in a stack of dockables.

Reason More control over the layout.

5.2.16 WindowProviders

Short New interface WindowProvider allows to change the root-window even after the framework runs.

Reason Some clients do not know their root window when setting up a controller, other clients did have a hard time to find the root-JFrame (like applets, which do not have such a frame).

5.2.17 AppletWindowProvider

Short A new WindowProvider is available, the AppletWindowProvider.

Reason This class supports Applets by finding the (normally hidden) window on which the applet lies.

5.2.18 LocaleListener

Short The new LocaleListener can be added to DockUI and will be informed if the Locale changes.

Reason Internal caches of Common can be cleaned through this listener.

5.2.19 DockController: freeze layout

Short DockController has new methods freezeLayout, meltLayout and isLayoutFrozen.

Reason These methods temporarily freeze the layout so clients can safely add and remove Dockables from the tree. Prevents the SingleParentRemover to do its work and change the tree at the same time.

5.3 Bugfixes

5.3.1 SplitDockStation not respecting acceptances

Short On a SplitDockStation a Dockable could be dropped over another element which didn't accept that combination.

5.3.2 Common and CGrid: not supporting big stacks

Short When dropping CGrid with stacks that have 3 or more elements, then an exception was thrown.

5.3.3 DockFrontend did not read setting correctly

Short The method read of DockFrontend did mark the main setting as simple entry while it should have been marked as main entry.

5.3.4 Infinite recursion in focus raversal

Short DockFocusTraversalPolicy would create an infinite recursion when used together with javax.swing.LegacyGlueFocusTraversalPolicy.

5.3.5 CWorkingArea not settings itself as working-area

Short The method deploy of CWorkingArea did not inform the children that they are now child of a working-area.

5.3.6 SplitDockGrid throwing exception

Short When the same coordinates were used twice or more for putting elements in a SplitDockGrid an exception was thrown.

5.3.7 FlapWindow not resizing

Short A FlapWindow did not always resize correctly when its parent got resized while the window was invisible. Fixed by Peter.

5.3.8 Dropping CWorkingArea

Short Dropping a CWorkingArea that has children did not work.

5.3.9 Drop CDockable with no location but working-area

Short A CDockable that has not set any location but belongs to a working-area will now use the default location for that working-area.

5.3.10 AbstractCDockable ignores settings

Short AbstractCDockable did not respond when setting an extended mode and another extended mode was disabled. The cause of this failure was a missing "break" in a "switch" statement.

5.3.11 SecureScreenDockStation not secure

Short SecureScreenDockStation was not using SecureScreenDockWindowFactory.

5.3.12 Exception in updateLocation

Short The method updateLocation of DockFrontend would throw an exception if a Dockable in the tree was at the same time a root-station.

5.3.13 Buttons on CDockable

Short When a minimzed CDockable was closed and then made visible again its extension-mode-buttons were not correctly set.

6 Version 1.0.8

This version brings many new features: the CLocationModeManager handles the location of CDockables, placeholders store the location of Dockables much more precise than the old system, tabs can be placed at any side.

The changes are ordered by the time when they were introduced.

6.1 Incompatibilities

The changes that need special care.

6.1.1 DockableDisplayerListener

- Short DockableDisplayers can now be observed by DockableDisplayerListeners.
- **Reason** This allows a DockableDisplayer to mark itself as obsolete, DockStations then can create new displayers.
- Clients Any class that uses DockableDislayers should add the listener and react on its events.

6.1.2 EclipseThemeConnectorListener

- Short EclipseThemeConnector can be observed by a EclipseThemeConnectorListener.
- Reason This allows to change properties even after asking the connector for them
- Clients Clients implementing a EclipseThemeConnector have to call the listener

6.1.3 FocusObserver: veto

- Short Focus transfer when clicking the mouse can now be canceled. The MouseFocusObserver calls a methode handleVeto which cancels an event.
- Reason A feature request by a user, should be used with care.
- Clients The new FocusVetoListener can be added to the focus observer and allows clients to cancel focus transfer.

6.1.4 DockProperties: priority

- ! API: DockProperties now supports different priorities for values, "default", "theme" and "client".
- **Short** DockProperties now stores properties with different priorities. "Client" overrides "theme", "theme" overrides "default".
- Reason Allows DockThemes and clients to use the properties together.
- Clients Should always register their properties with priority "client".

${\bf 6.1.5}\quad {\bf CLocation Mode Manager}$

- Short CStateManager got replaced by CLocationModeManager.
- Reason The CLocationModeManager is built much more generic than CStateManager allowing new DockStations and new extended-modes.
- Clients The method CControl.getStateManager was renamed to getLocationManager.

6.1.6 SplitDockStation: leaf id

Short Each node of a SplitDockStation has now a unique identifier.

Reason This identifier is used to store the location of a Dockable.

Clients This is a change in the internal API, clients are not affected.

6.1.7 DockTitleRequest

Short DockTitleFactory has been changed. Now a DockTitleRequest is installed on the factory, the factory may trigger this request anytimes (also more than once). The new class StationChildHandle manages the interaction between Dockable, DockableDisplayer, DockTitle and DockTitleRequest.

Reason The API is now much more consistent. Also anyone knowing a DockTitleRequest can update/replace the title at any time.

Clients Please read chapter 5 "Titles" of the guide for Core.

6.1.8 DockFrontend: methods moved

Short Some methods of DockFrontend have been moved to DefaultLayoutChangeStrategy.

Reason Allows Common to handle its special needs, e.g. to reuse MultipleCDockables when the layout changes.

Clients This API was used internally, clients should not be affected.

6.1.9 Placeholders

Short Placeholders remain at the position where a Dockable was removed. The feature is implemented in Core but only activated if Common is used.

Reason This makes location information much more resilient against failures due to missing Dockables.

Clients May need to implement a PlaceholderStrategy if they want to use placeholders in Core. All existing layout information will be upgraded automatically. It is not possible for an old version of DockingFrames to read a layout written with 1.0.8.

6.1.10 EclipseTheme respects settings of StackDockStation

Short BaseTabComponent is no longer responsible for keeping icon and text up to date, this must be handled by the StackDockComponent.

Reason This means that the EclipseTheme now respects the text and icon set by the StackDockStation

Clients This API was used internally, clients should not be affected by these changes

6.2 API and Layout

A list of new API elements and changes that affect the layout.

6.2.1 EclipseTheme, no-title and tabs

Short New CommonEclipseThemeConnector ensures that CDockable with no title do not have a tab if not necessary in the EclipseTheme.

Reason Since tabs are used like titles in the EclipseTheme, they also should be hidden if the no-title property is set.

- API: new CVetoFocusListener in Common, can speak a veto for some focus changes

6.2.2 CVetoFocusListener

Short A new CVetoFocusListener can be added to CControl.

Reason The listener can be used to cancel focus changes, should be used with care.

6.2.3 SingleTabDecider

Short The interface SingleTabDecider allows Dockables to be displayed with a tab, even if a tab is not necessary.

Reason Creates a new look and a new feeling if combined with a no-title feature.

6.2.4 CDockable single-tab

Short CDockable has a new property singleTabShown which is forwarded to a SingleTabDecider

Reason Allows clients to enabled/disable single tabs for each CDockable individually.

6.2.5 Tab placement

Short New property StackDockStation.TAB_PLACEMENT globally sets where to put tabs. Must be supported by the current TabLayoutManager.

Reason Allows clients more customization.

6.2.6 TabLayoutManager

Short New class TabLayoutManager to handle the positioning of tabs on a StackDockStation.

Reason Decoupling of looks (tabs) and logic (their position).

6.2.7 CPanelPopup

Short New action CPanelPopup in Common provides an easy way to create a popup-action with an arbitrary Component as content.

Reason Allows more customization.

6.2.8 Access to actions of CDockable

Short CDockable has new methods getAction and getActionCount to access CActions that were added.

Reason Clients no longer have to remember what actions they added.

- API:

6.2.9 Minimum size on FlapDockStation

Short New key FlapDockStation.MINIMUM_SIZE sets the default minimum size of FlapDockStations.

Reason To make sure a Dockable does not get too small.

6.2.10 CContentArea.setMinimumAreaSize

Short CContentArea.setMinimumAreaSize set the minimum size of minimized CDockables.

Reason To make sure a CDockable does not get too small.

6.2.11 AbstractDockable: KeyListener

Short AbstractDockable has new method add/removeKeyListener.

Reason Allows to observe any KeyEvent that is related to a Dockable. Children of dockable DockStations are ignored.

6.2.12 CVetoClosingListener

 ${\bf Short}\ {\bf A}\ {\bf CVetoClosingListener}\ {\bf can}\ {\bf be}\ {\bf added}\ {\bf to}\ {\bf CControl}\ {\bf or}\ {\bf CDockable}.$

Reason The listener is called before a Dockable or a set of Dockables is closed. The listener may cancel the operation.

6.2.13 AbstractCDockable: createCommonDockable

Short AbstractCDockable has a new method createCommonDockable.

Reason Clients can override the method and thus customize the Dockable which represents the CDockable.

6.2.14 Merger

Short The interface Merger allows two DockStations to be merged automatically.

Reason The implementation StackMerger merges to StackDockStations. This allows to drag a stack of Dockables at a new location.

6.2.15 StackDockStation: single tab

Short A StackDockStation with only one child can still show a tab depending on the type of StackDockComponent

Reason A feature request by a developer.

- API: ScreenDockStation now supports fullscreen mode for its children. What "fullscreen" means can be influenced by a ScreenDockFullscreenStrategy.

6.2.16 ScreenDockStation: fullscreen mode

Short ScreenDockStation now supports fullscreen mode for its children. The exact meaning of "fullscreen" is defined by a ScreenDockFullscreenStrategy.

Reason Because it was really missing.

6.2.17 TabContentFilter

Short The new interface TabContentFilter tells the framework what to show on a tab.

Reason Allows some more customization, e.g. show only short titles.

6.2.18 FlapDockStation: factory

Short FlapDockStation supports factory for creating the window

Reason To use FlapDockStation on a JInternalFrame.

6.2.19 StackDockComponent: default representation

Short StackDockComponent now offers a method createDefaultRepresentation.

Reason This allows code to be executed when clicking on, or dragging of, an empty space arounds tabs.

6.2.20 DropDownMenu: selection if submenu

Short Clicking on a child action of a DropDownAction that is shown as submenu now changes the selection of the button as well.

Reason That is the expected behavior.

6.2.21 SplitDockFullScreenProperty

Short New property SplitDockFullScreenProperty.

Reason This property points to a fullscreen Dockable on a SplitDockStation and can be used to merge that element with another Dockable.

6.2.22 CMaximizedLocation

Short Extends now AbstractStackholdingLocation.

Reason Allows to combine a maximized Dockable with another Dockable

6.2.23 OrientationToRotationStrategy

Short New interface OrientationToRotationStrategy.

Reason The strategy allows clients to specify how to rotate text on a DockTitle

6.3 Bugfixes

6.3.1 EclipseStackDockComponent: Exception

Short EclipseStackDockComponent contained an unnecessary and not correctly updated list of Dockables causing an IndexOutOfBoundsException on JREs of version 1.5.0_12 or higher.

6.3.2 AWT and Glass-Pane

Short Workaround for bug http://bugs.sun.com/bugdatabase/view_bug. do?bug_id=6797587, AWT components not painted properly if behind a glass-pane.

6.3.3 Check before drop

Short DockStations check whether dropping some Dockable would create an invalid Component-tree, and forbid such drag and drop operations

6.3.4 SimpleDockACtion: unbinding

Short SimpleDockAction did not unbind itself correctly due of events fired in an unfortunate order. Repaired thanks to an anonymous user.

6.3.5 StackDockStation: reselect

Short When making a selected Dockable on a StackDockStation invisible, a new Dockable should be properly selected.

6.3.6 RequestDimension: constructor

Short RequestDimension(int, boolean) did not set the height property.

6.3.7 MultiDockActionSource: exception

Short Wrong index in MultiDockActionSource.add(DockActionSource) could lead to IndexOutOfBoundsException.

6.3.8 SplitDockStation: cursor

Short Cursor on the SplitDockStation sometimes does not change from arrow to default cursor. Should happen less often now, patch by Eduardo Born.

6.3.9 FlatTab: mouse events

Short FlatTab did not react on mouse-dragged events if in a "secure environment".

6.3.10 StackDockStation: not removed

Short StackDockStation was not always removed if it had only one child and this one child was a CDockable associated with a CWorkingArea.

6.3.11 FlapDockStation: exception on move

Short Moving a Dockable on a FlapDockStation did throw an exception if the destination index was too big.

6.3.12 Location of missing CDockable

Short If a CDockable is removed and the CMissingDockableStrategy tells to store information about that Dockable, then its location remains now stored.

6.3.13 Tabs: wrong size

Short If TabPlacement was "left" or "right", then new tabs in a StackDockStation could be too big. Reason for this bug was that new tabs were not properly initialized and assumed that TabPlacement was "top".

6.3.14 Tabs: missing tabs

Short StackDockStation did not add its children correctly to the StackDockComponent, leading to some missing tabs

6.3.15 Exception on normalizing

Short Normalizing a externalized CDockable could throw an Exception

6.3.16 StackDockStation: move

Short StackDockStation could not be moved around in Common even if children would allow it.

6.3.17 Placeholders: missing

Short Dragging a station away from another station did not store placeholders

6.3.18 StackDockStation: selection changes

Short During drag and drop, dragging the mouse over a tab of a StackDockStation could exchange the selected Dockable.

6.3.19 ScreenDockStation: exception

Short Dragging a Dockable over a child of a ScreenDockStation could throw an exception (in Common).

6.3.20 StackDockStation: no event

Short StackDockStation did not fire dockable-selected event properly when using the DefaultStackDockComponent.

6.3.21 Tabs: strange position

Short Tabs with unequal height were positioned strangely.

6.3.22 DefaultStackDockComponent: popup menus

Short Popup menus are now enabled for tabs on a DefaultStackDockComponent

6.3.23 DockRegister: missing events

Short If DockRegister was stalled and a DockStation was added/removed to the register and later Dockables added/removed from that station, then the DockRegister could miss these modifications and store too many/few Dockables.

6.3.24 CActionSource: missing events

Short CActionSource did not fire events when removing or replacing actions

${\bf 6.3.25}\quad {\bf CLocation Mode Manager:\ exception}$

Short CLocationModeManager.setLocation did not compare the correct objects and has always thrown an exception.

6.3.26 Corner components: wrong location

Short Minimized CDockables did not appear at the correct location if corner components were used

6.3.27 Maximized CDockable: exception

Short Dragging a maximized CDockable could throw an exception

6.3.28 BasicStackDockComponent: exception

Short Dragging a tab from a BasicStackDockComponent could throw an exception

6.3.29 Path: wrong encoding

Short Path did not encode non-java identifiers right.

6.3.30 EclipseMenu: update icon

Short EclipseMenu did not update its icon automatically

6.3.31 StackDockStation: move

Short StackDockStation.move(Dockable,DockableProperty) could throw exception if destination index was too big.

6.3.32 AbstractScreenDockWindow: wrong update

Short AbstractScreenDockWindow.setDockable did call updateTitleIcon instead of updateTitleText.

6.3.33 DockTitleTab: exception

Short DockTitleTab caused exception when uninstalled

6.3.34 PropertyPreference: load default

Short Instead of doing nothing, PropertyPreferences now load their default value if they cannot read any other value.

6.3.35 CGrid: missing Dockables

Short When deploying a CGrid some Dockables did not appear: the tree of the SplitDockStation was cleaned up too early before all Dockables had been inserted, leading to a corrupted tree.

6.3.36 SplitDockStation: wrong id

Short SplitDockStation did assign leaf-id to node when using drop(SplitDockPathProperty). As a result unmaximizing a stack of CDockables could destroy the stack.

6.3.37 SplitDockStation: update layout

Short SplitDockStation does now always update the boundaries of its tree before dropping a Dockable. Wrong boundaries did lead to Dockables dropped at the wrong location even if the used DockableProperty was correct.

6.3.38 Path: encoding

Short Path now encodes its content when using toString and decodes contents on creation. Meaning inside a Path object the items are never encoded.

6.3.39 MouseFocusObserver: request focus

Short MouseFocusObserver no longer calls requestFocusInWindow if a Component does not belong to a Dockable

6.3.40 SplitDockStation: placeholders

Short SplitDockStation is now much more strict when it comes to enforcing the uniqueness of placeholders

6.3.41 Dockable CStation issue

Short If a CStation was registered at a CControl and later the same object was registered as a SingleCDockable, then CControl did not assign a unique identifier to that Station/Dockable.

6.3.42 SimpleDockAction: memory leak

Short SimpleDockAction.KeyForwarder caused a memory leak by not removing its listeners properly.

6.3.43 CLocation: null root

Short CLocations returning null as root but having an ExtendedMode are (again) supported.

6.3.44 SplitDockStation: locked size

Short When moving/dragging a Dockable from a SplitDockStation with size-locked Dockables, the locked Dockables got resized even if it was not necessary.

6.3.45 DockUI: stalls events

Short DockUI now stalls all events rather than setting the SingleParentRemover to null when updating the DockTheme of a station

6.3.46 CLayoutChangeStrategy: exception

Short CLayoutChangeStrategy.replaceMultipleDockables could throw a NullPointerException.

6.3.47 CDockable: base location

 $\begin{tabular}{ll} \bf Short \ CDockable.getBaseLocation \ did \ return \ null \ when \ a \ location \ was \ actually \ available \end{tabular}$

6.3.48 Glass Extension

Short Glass Extension no longer throws Exception if width or height of tab is equal to 0.

6.3.49 SplitDockStation: cursor

Short Cursor should no longer remain arrow when moved away from a divider of a SplitDockStation.

7 Version 1.1.0

From this version on only incompatible changes will be listed in the document. The compatible changes and bugfixes either do not affect clients, or can be found in the changes.txt file already.

7.1 Incompatibilities

7.1.1 SincleCDockableBackupFactory

Short SingleCDockableBackupFactory was replaced by the new SingleCDockableFactory.

Reason There is no reason to call it a "backup" factory anymore. It is now just a factory like any other factory.

Clients Have to replace the interface wherever it appears, the methods remain the same.

7.1.2 Interface Combiner updated

Short The interface Combiner has been completely rewritten.

Reason The Combiner has now much more control of how two Dockables are going to be merged. It can even paint on the DockStation during a drag and drop operation.

Clients Any implementation of Combiner has to be implemented anew from scratch.

7.1.3 PlaceholderList update

Short PlaceholderList is now abstract and has more generic arguments.

Reason This allows subclasses which are used by the API for perspectives.

Clients Can use DockablePlaceholderList instead of PlaceholderList.

7.1.4 DockFactory has new methods

Short DockFactory has additional methods and new generic arguments.

Reason All these changes are to support the perspective API.

Clients Can either ignore the new methods (e.g. always return null) or have to implement the new methods if they want to use perspectives.

7.1.5 Various new generic parameters and abstractions

Short Various classes and interfaces have new generic parameters and/or were made abstract.

Reason These changes where necessary in order to support the new perspective APL.

Clients Can either ignore the changes if they do not use the perspective API, or implement missing parts. However, most clients should not notice these changes as they were made in a layer that is not accessed by most clients.

7.1.6 Working-area set during loading

Short Common now stores the identifier of the working-area which owns a SingleCDockable and changes the working-area property when loading a layout.

Reason This was required by the perspective API, otherwise working-areas could not have been supported.

Clients Should not be affected by this change as clients normally do not change the working-area of a Dockable.

7.1.7 UIProperties depend on UIScheme

Short UIProperties now depend on UIScheme.

Reason UISchemes are a good way set the default values of an UIProperties . The mechanism was first introduced for the ColorManager but is now generalized.

Clients The API of the ColorScheme has changed and clients may need to reimplemented classes based on ColorScheme.

7.1.8 Introducing ThemeManager

Short The importance of the interface DockTheme has much decreased.

Reason The new ThemeManager allows clients to override properties related to a DockTheme without the need to access the DockTheme.

Clients Clients will not notice any change as the API for DockTheme remaines unchanged. However, developers should be aware of the ThemeManager which is much more convenient to use then subclassing DockThemes.

7.1.9 "secure" classes obsolete

- **Short** All "secure" classes are obsolete, instead the property "restricted environment" in DockController is to be used.
- **Reason** This change reduces complexity as the same code can now be used in a standard application and in an unsigned applet.
- Clients The old classes have been marked deprecated, clients should remove any references to the old "secure" classes.

7.1.10 SplitDockStationFactory

Short SplitDockStationFactory now stores whether a SplitDockStation did have a fullscreen-action or not.

Reason Otherwise the setting could be corrupted when loading a layout.

Clients Should treat this like a bugfix.

7.1.11 Renaming in focus API

Short Renamed: FocusController to VisibilityFocusObserver, DockController.getFocusObserver to getMouseFocusObserver and added new interface FocusController.

Reason Part of an ongoing effort to hide all controller-classes behind interfaces.

Clients Most clients are not affected. Clients implementing a focus system have to use the new interface.

7.1.12 FocusVetoListener added to FocusController

Short FocusVetoListener is now added to FocusController instead of MouseFocusObserver.

Reason Part of an ongoing effort to hide all controller-classes behind interfaces. Also the listener is now asked more often for a veto.

Clients May need to replace references to MouseFocusObserver by references to FocusController.

7.1.13 ButtonContent is now a class

Short The enum ButtonContent is now a class.

Reason The new class allows much finer control of what is to be displayed on a FlapDockStation

Clients The old constants remain available, clients have to update their import statements since ButtonContent is now a top-level class.

7.1.14 ButtonContentPreference replaced

Short ButtonContentPreference got replaced by the new ButtonContentPreferenceModel.

Reason Because the ButtonContent class now offers much more options that before.

Clients Have to update any reference to ButtonContentPreference.

7.1.15 IconManager and DockIcon

Short The IconManager now extends UIProperties.

Reason Allows much more control over the icons.

Clients All icons have now to be accessed through a DockIcon, direct access of the icons is deprecated.

7.1.16 IconManager handles all icons

Short All icons are now handled by the IconManager, DockUI and Resources are no longer handling any icons.

Reason This more centralized approach makes customization of icons much easier.

Clients Any access to icons has now to go through the IconManager.

7.1.17 Unique identifiers of SplitNodes

Short The unique identifier of a SplitNode may change if a new child is added to the tree.

Reason Required in order to resolve collisions of identifiers.

Clients Clients should not treat the unique identifier as a constant.

7.1.18 TextManager

Short All the text that appears on buttons/titles/etc. is now handled by the TextManager.

Reason This allows clients to modify the text, or even load additional language packages.

Clients Any access to text has now to go through the TextManager.

7.1.19 DockStationListener updated

Short DockStationListener has an additional method dockableRepositioned.

Reason Allows the framework and clients to better keep track of the location of a Dockable.

Clients Any class implementing DockStationListener has to implement the new method. Any class implementing DockStation has to invoke the new method

7.1.20 Class Resources removed

Short The class Resources has been removed.

Reason Icons are now handled by the IconManager, text is now handled by the TextManager and the default bundle is now loaded in CControl. initTexts using a DefaultTextScheme.

Clients Must use IconManager and TextManager instead.

7.1.21 CDockableStateListener updated

Short CDockableStateListener no longer has one method for each ExtendedMode, instead one method handles all possible ExtendedModes.

Reason This keeps the option of new ExtendedModes open.

Clients Clients can extend CDockableAdapter to keep the old API.

7.1.22 DockSituation uses two PlaceholderStrategies

Short DockSituation can now use a PlaceholderStrategy to load the intermediate format and another strategy to load the final DockElements.

Reason Allows more flexibility.

Clients May need to set the PlaceholderStrategy twice in order to have the desired effect.

7.1.23 DockRelocator updated

Short DockRelocator has two additional methods getRemote and getDirectRemote with a parameter forceDrag.

Reason Allows clients to force start a drag and drop operation.

Clients Clients implementing the DockRelocator interface need to implement the new methods as well.

7.1.24 New CGroupMovement

Short CGroupBehavior now creates a CGroupMovement instead of executing its changes directly.

Reason Allows to reuse existing code much easier.

Clients Clients implementing a CGroupBehavior may now need to implement a CGroupMovement as well.

7.1.25 CMaximizedBehavior removed

Short CMaximizedBehavior and all associated methods have been removed.

Reason All the functionality of CMaximizeBehavior is now implemented by the CGroupBehavior.

Clients Clients implementing a CMaximizedBehavior must now implement a CGroupBehavior instead.

7.1.26 DockUI updated

Short Several methods of DockUI have been removed, this includes the LocaleListener.

 ${f Reason}$ This functionality was replaced by the ${f ThemeManager}$ and the ${f TextManager}$.

Clients Have to use the managers instead of DockUI.

$7.1.27 \quad {\bf Methods\ renamed\ in\ StackDockComponentParent}$

Short Some methods in StackDockComponentParent renamed.

Reason Prevents conflicts with methods in other interfaces that have the same signature but different usage.

Clients Must rename these methods as well.

7.1.28 CControlFactory updated

 ${\bf Short}\ {\tt CControlFactory}\ {\tt now}\ {\tt creates}\ {\tt CommonStation}\ {\tt instead}\ {\tt of}\ {\tt DockStations}.$

Reason All DockStations used by a CStation now implement the interface CommonStation.

Clients Clients implementing CControlFactory have to implement the new methods as well.

7.1.29 CommonStation updated

Short CommonStation no longer extends CommonDockable.

Reason Because not every DockStation is to be treated like a Dockable.

Clients Any code assuming that a CommonStation is a CommonDockable has to be updated.

7.1.30 New interface CommonElement

Short The interface CommonElement is the parent interface of CommonDockable and CommonStation.

Reason Represents the DockElement.

Clients The type system should now enfoce the correct implementation of all the different methods. Clients may need to update custom DockStations.

7.1.31 AdjacentDockFactories and PerspectiveElements

Short AdjacentDockFactorys can now also write meta data for PerspectiveElements.

Reason More support for the perspective API.

Clients Clients implement AdjacendDockFactory may need to update the implementation.

7.1.32 PopupController accessible

Short The PopupController is now accessible for clients by calling getPopupController, a method of DockController.

Reason Allows customization of the popups.

Clients Clients can now install their custom DockPopupMenuFactory and change the way popup menus behave.

7.1.33 DockRelocator updated

Short DockRelocator is now an interface.

Reason Part of an ongoing effort to hide all controller classes behind interfaces.

Clients Clients may need to extend from one of the subclasses of DockRelocator instead of DockRelocator directly.
